

every
condition

Each row is a separate polling case, not a time series. Positive net news favors the candidate.
Within a city, its typical responsiveness is stable across cases, although end polls remain noisy.

A new City C case begins with a poll of 53.9 and has net news +5. What poll do you predict?

CITY C · the city being forecast

Case	Start	News	Change	End
1	57.8	+8	+9.4	67.2
2	57.8	-8	-1.8	56.0

zero to four rows shown, by condition

(a)

CITY A

Case	Start	News	Change	End
1	45.4	-8	-6.5	38.9
2	45.4	+8	+12.2	57.6

four rows shown

(b)

CITY B

Case	Start	News	Change	End
1	35.0	-10	-5.6	29.4
2	35.0	+10	+9.3	44.3

four rows shown

Context cue, appended to the City C block

Background: City C residents generally encounter campaign developments through national news coverage.

names the strong-response city

(c)

Background: City C residents generally encounter campaign developments through local news coverage.

names the weak-response city instead

(d)

Background label: KIV. (City A is KIV, City B is ZOR)

label has no fixed meaning; recoverable only from A and B

(e)
